

Applied Behavior Analysis
at
Youngstown State University

Stephen A. Graf, Ph.D.

Key Materials

- *Elementary Principles of Behavior*, 2nd Ed. (Whaley, Malott and Malott)
- SAFMEDS [Flashcard Fluency Follies]
- Contingency diagrams

Key Procedures

- 4-minute Free/Write (4 per week)
- Daily See/Say SAFMEDS (7 per wk)
- Hear Questions/Say Answers

- Hear/Complete examples & non-examples on Contingency Diagrams

Format: Symposium

Title: **Teaching Behavior Analysis**

Behavior Analysis at Youngstown State University

In the applied behavior analysis course at Youngstown State University, students engage in timed practices covering course material each class period, monitor their own performances daily, and spend the majority of class time orally explaining concepts and examples to their instructor and classmates. Instructor behavior does not include lecturing. The course uses Whaley, Malott & Malott's 1992 *Elementary Principles of Behavior* as text, along with Lindsley's 1991 unpublished paper, "Skinner on Measurement." Each class begins with a four-minute free-write on the reading assignment. Students develop structured writing styles, and receive points for appropriately organized relevant chunks of information. Students then pair off and take turns doing one-minute SAFMEDS timings. Students see a definition or phrase on the front of a card and attempt to say the concept label found on the back. All students monitor their daily progress on three SAFMEDS decks with Standard Celeration Charts. During the remainder of class, students provide oral answers to either study questions from the reading assignment or contingency diagrams involving examples. They receive points for appropriate contributions. Students earn grades based on prespecified point totals and degree of SAFMEDS fluency. They evaluate the course highly on facts learned and daily effort expended.

Format: Symposium

Title: **Teaching Behavior Analysis**

Behavior Analysis at Youngstown State University

Two courses at Youngstown State University in Youngstown, Ohio provide an unofficial sequence in which students engage in timed practices covering course material each class period, monitor their own performances daily, and spend the majority of class time orally explaining concepts and examples to their instructor and classmates. The first course represents about 200 of the 1150 students each quarter taking a first course in introductory psychology with a behavioral slant. Malott & Whaley's *Psychology* provides the text material and students attempt to achieve fluency on pronunciation of difficult terms, saying or writing basic principles of behavior analysis, and responding to SAFMEDS covering the course content. They also respond to study questions from the text but not at fluency levels of performance. The second course represents applied behavior analysis as the subject matter per se, and uses Whaley, Malott & Malott's *Elementary Principles of Behavior* as text, along with Lindsley's paper, "Skinner on Measurement." Each class begins with a four-minute free-write on the reading assignment. Students use structured writing styles similar to Information Mapping™, and receive points for relevant chunks of information appropriately organized. Next students pair off and take turns doing one-minute flashcards from one of three decks, organized according to complexity of answer. Students see a definition or phrase on the front of the card and attempt to say the procedure or concept label found on the back. All students monitor their daily progress on all three decks with Standard Celeration Charts. Most of the remainder of class time involves students providing oral answers to study questions from the reading assignment, with points awarded by the instructor for appropriate contributions.

CALENDAR WEEKS

Charts - well done

Jay D. Barnett
11/16/92
Charting Project

Description - Good job, particularly
liked your specification of
the celebrations.

12/11

23

X Deck - The hits on the X Deck were accelerating.
The misses on the X Deck were maintaining.

Y Deck - The hits on the Y Deck were accelerating.
The misses on the Y Deck were maintaining.

Z Deck - The hits on the Z Deck were accelerating.
The misses on the Z Deck were accelerating.

Strategy - At first, when we had one deck, I was
going through the cards one time and
doing one one minute timing per
day.

Once the decks were split up, I changed
strategies.

On the X Deck, I went through them three
times per day (three one minute timings)
until the end. At the end, I went through
them seven to eighteen times per day
(one minute timings).

On the Y Deck, I consistently went through
them three times per day (three one minute
timings).

On the Z Deck, I consistently did five
one minute timings per day.

I kind of enjoyed doing the SAFMEDS
once I started progressing on them.

Greg D. Barnett
4/16/92
Charting Project

At first, they seemed impossible, but the splitting them into three decks helped me an awful lot.

The thing that helped me the most on the SAFMEDS was highlighting. Once I highlighted the deck, my hits seemed to go up very rapidly.

I feel that I learned a lot from the SAFMEDS, and I think that they are an unusual but effective way of teaching.

MEMO

To: Copresenters
From: Dick Malott
Date: Monday, November 16, 1992
Subject: ABA Symposium

Here's a copy of our submission to ABA, modified with the addition of multiple columns and the elimination of page breaks to conserve paper. I appreciate your participation. Looks like it should be an excellent seminar.

I would like to keep each presentation to 10 minutes. This way we can prevent audience burnout and still have time for interesting commentary by each participant on the presentations of the others and questions and comments from the audience.

Symposium: Using Behavior Analysis to Teach Behavior Analysis

1. **Format:**
Symposium
2. **Duration:**
80 minutes
3. **Session Title:**
Teaching Behavior Analysis
4. **Chair:**
RICHARD W. MALOTT (Western Michigan University)
Department of Psychology,
Western Michigan University,
Kalamazoo, MI 49008-5052
5. **Discussant:**
None
6. **Presentations:**
Cost-Benefit Analysis of a PSI Course for Graduate Students
DOUGLAS GREER and Cynthia Phelan (Columbia University-New York, NY and The Fred S. Keller School-Yonkers, NY)

Free Operant Responding: An Alternative for Evaluating Student Performance in Higher Education.
JOHN O. COOPER (The Ohio State University-Columbus, OH)

Teaching Behavior Analysis to Undergraduate Physical Education Majors
PHILLIP WARD (The Ohio State University-Columbus, OH)

Behavior Analysis at Youngstown State University
STEPHEN A. GRAF (Youngstown State University-Youngstown, OH)

Using Contingency Diagramming to Teach Behavior Analysis
RICHARD W. MALOTT and Guillermo Yaber (Western Michigan University-Kalamazoo, MI)

7. **Descriptors:**

Department of Psychology,
Western Michigan University,
Kalamazoo, MI 49008-5052
10. **Assurance:**
If the proposed session is accepted, I agree to conduct it or arrange for it to be conducted at the 1993 Convention as scheduled by the Program Committee. I have received assurances from the other participants that they also agree to deliver their presentations or arrange for them to be delivered, as proposed for this session.

Overall Session Abstract:

1. **Title of Symposium.**
Teaching Behavior Analysis
2. **Name of the chair and affiliation.**
RICHARD W. MALOTT (Western Michigan University)
3. **Name of the discussant and affiliation.**
None
4. **Abstract.**
Many members of ABA teach behavior analysis at the university level. Many of those teachers use behavioral technology to teach behavior analysis. Many of those users of this behavioral technology no longer share their technology with their colleagues. This symposium is a small step toward correcting that problem.

Individual Presentation Abstract: GREER

1. Title.

Cost-Benefit Analysis of a PSI Course for Graduate Students

2. Authors and affiliations.

R. DOUGLAS GREER and Cynthia Phelan
(Columbia University-New York, NY and
The Fred S. Keller School-Yonker's, NY)

3. Abstract.

Procedures for doing cost-benefit analyses in schools were applied to a graduate-training course that used the PSI model. The course was an introductory course on behaviorology, behavior selectionism, and the science of pedagogy. Procedures used in the course have evolved over a twenty-year period. The current model allows for a cost-benefit analysis tied to learn units, course objectives, and tuition cost. The data and the operations for performing a cost-benefit analysis will be shared with participants.

3. Abstract.

Written responses to multiple-choice questions, true-false questions, fill in the blanks, and matching items are the most common procedures used to evaluate student performances in higher education. The professor controls the performance of the learner. These evaluation procedures have ceiling scores (i.e., you cannot do any better than all correct) and do not record the amount of time used to respond. The

procedures are not evaluations of how well the learner can perform. This presentation will consider alternatives to the common restricted-operant evaluations in higher education. The audience will learn how a large class of students, rather than the instructor, can control their individual performance evaluations. Most higher-education performance evaluations use a see-to-write learning channel set (i.e., the student sees the question and circles the answer, writes the answer, or draws a line to match items). The audience will learn how a variety of learning channel sets can be used for evaluation (e.g., think-to-say, see-to-say, and think-to-write).

Teaching Behavior Analysis to Undergraduate Physical Education Majors

2. Authors and affiliations.

PHILLIP WARD (The Ohio State University-Columbus, OH)

3. Abstract.

This paper describes the instructional design of a required two-course sequence in behavior analysis taught to undergraduate physical education majors at The Ohio State University. The course, titled "Behavioral Dimensions of Educational Settings: Principles and Applications," meets three days per week for an hour per day across two quarters. The content of the course was derived from the text *Applied Behavior Analysis* (Cooper, Heron, & Heward, 1987). The instructional strategies used in the course were selected from research on teaching using effective Precision Teaching and Behavior Analysis strategies. These strategies, derive principally from elementary-school and special-education settings, were modified slightly to meet the particular requirements of the undergraduate setting. Specific strategies included time trials using SAFMEDS (Say-All-Fast-One-Minute-Each-Day-Shuffle), response cards, human-operant laboratory tasks analogous to those used in a "rat lab," and weekly exams which test for generalization. Data from the SAFMEDS trials and weekly exams are reported as well

as some initial tests for maintenance conducted one quarter after the conclusion of the course.

Individual Presentation Abstract: MALOTT

1. Title.

Using Contingency Diagraming to Teach Behavior Analysis

2. Authors and affiliations.

RICHARD W. MALOTT and Guillermo Yaber (Western Michigan University-Kalamazoo, MI)

3. Abstract.

The authors have a combined history of 40 years teaching behavior analysis. They think they have almost figured out how to do it--at least 60 percent of it. However, they are still trying to figure out what *it* is. They think *it* is that their students be able to reliably recognize, generate, and apply the concepts and principles of behavior analysis to novel examples. To this end, their students a) read a text with definitions, examples, and contingency diagrams (e.g.,

before [rat has no water] ==> behavior [rat presses lever] ==> after [rat has water]
before [boy has tokens] ==> behavior [boy disrupts class] ==> after [boy has no tokens]),

b) use *Think Fast* (a computerized flashcard program and regular preprinted flashcards to memorize definitions and diagramed examples, c) use contingency diagrams to generate and analyze novel examples, d) use job aids to analyze contingencies, e) use structured seminars to share feedback and practice analyses. The authors support their timid claims of success with performance measures and social validation data.
